Smart Devices with Micro:Bit

What is a
smart device?

How many can
you think of?

Smart Devices

Smart devices are **electronic devices** that:

- Have **electronic sensors** to observe their surroundings
- Use data from the sensors to **act autonomously** (on their own)
- **Communicate** with other devices connected to a **network**.

DIY Smart Devices

Intro to Micro:Bit

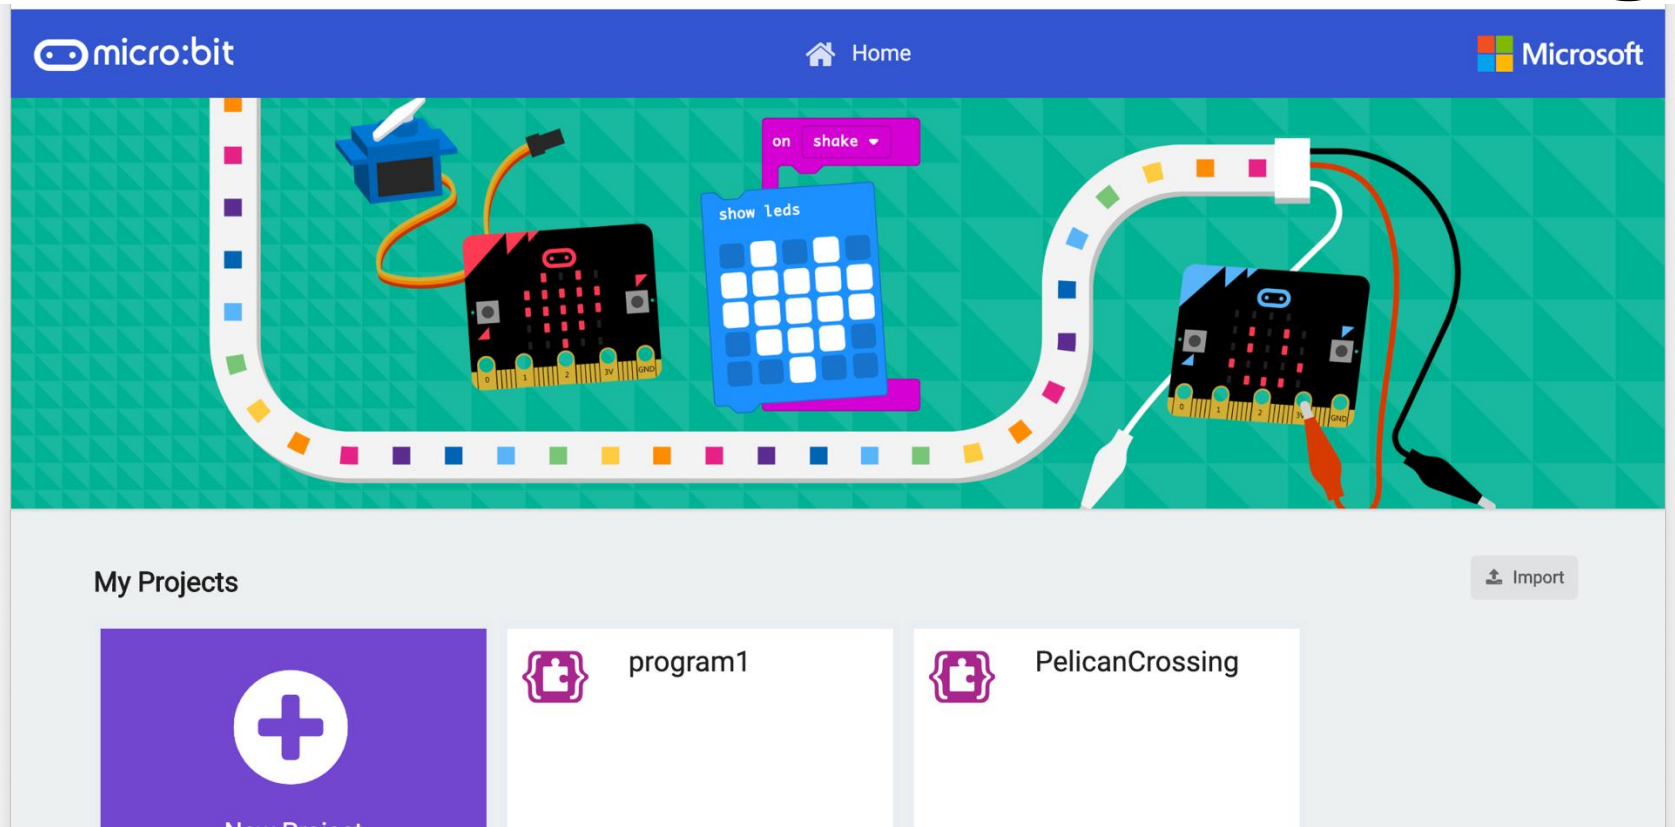

What is a micro:bit?

Starting with MakeCode

makecode.microbit.org

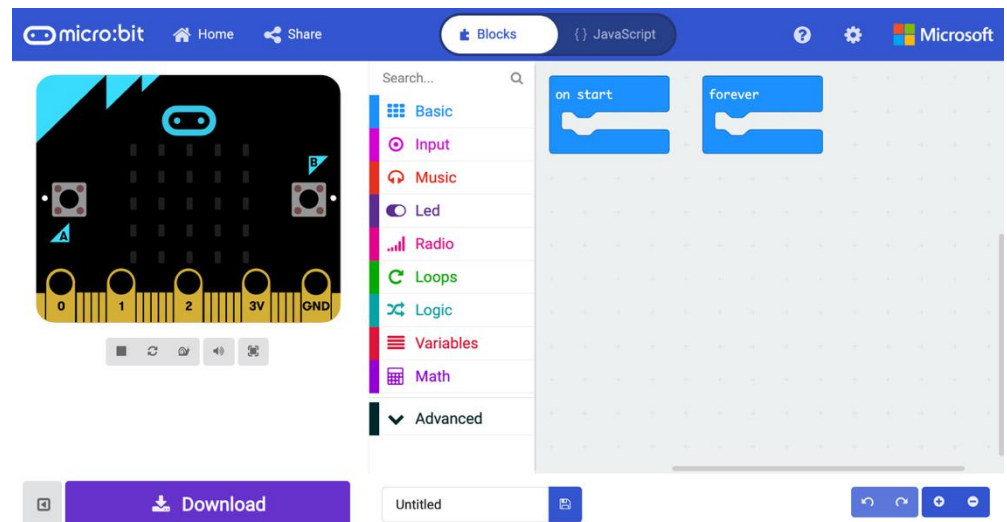

Starting with MakeCode

Click New Project

It should look like this!

Simulator

Language

The screenshot shows the Microsoft MakeCode micro:bit editor interface. At the top is a blue header bar with the 'micro:bit' logo, 'Home' and 'Share' links, a 'Blocks' button (highlighted with a purple arrow), a 'JavaScript' button, and a 'Microsoft' logo. Below the header, the interface is divided into three main sections. On the left is the 'Simulator' (highlighted with a purple arrow), which displays a virtual micro:bit board with pins labeled 0, 1, 2, 3V, and GND. In the center is a 'Language' menu (highlighted with a purple arrow) with a search bar and categories: Basic, Input, Music, Led, Radio, Loops, Logic, Variables, Math, and Advanced. On the right is the 'Code Window' (highlighted with a purple arrow), which shows a grid of code blocks including 'on start' and 'forever'. At the bottom left is a purple 'Download' button (highlighted with a purple arrow). At the bottom right are buttons for 'Untitled', 'Save', and 'Download'.

Save and Download

Code Window

Activity: Sense Testing

Activity: Sense Testing

Let's test our micro:bits by playing with the sensors

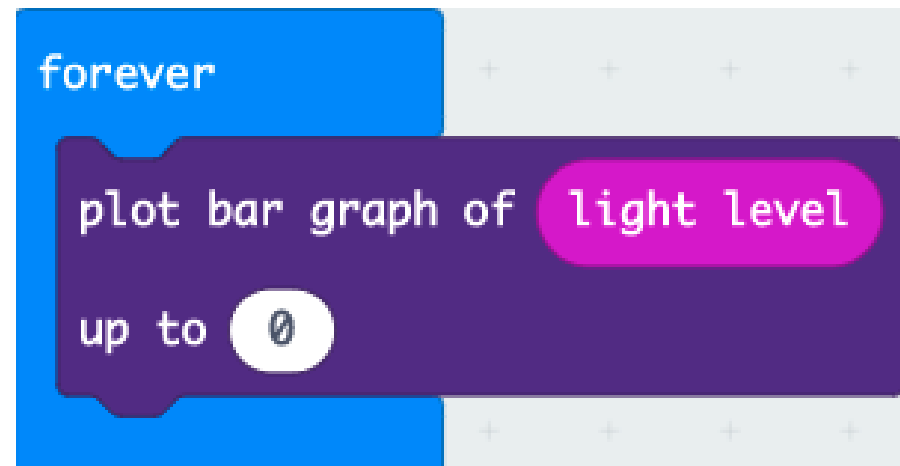

Copy this code:

light level is in the Input tab

plot bar graph is in the Led tab

Upload the code to your Micro:Bit – what's going on?

Try swapping out light level for sound level (in the Input tab)

Connecting the micro:bit

1. Plug the micro:bit into your computer

2. In the bottom left of your screen, click the 3 dots next to 'Download', then

click 'Connect Device'

3. Follow the on-screen instructions until you see this popup

4. Click the name of your device (it should be the only option)

5. Click connect

Activity: Let's Build a Circuit

Electricity needs a complete loop from + to - or it cannot flow through the circuit

Let's Build a Circuit

Connect your LED to the 3-Volt (**3V**) and Ground (**GND**) pins:

- **3V** → LED long leg
- **GND** → LED short leg

What happens when you turn on the micro:bit?

What happens when you swap around the legs of your LED?

What haven't we used?

Let's Build a Circuit

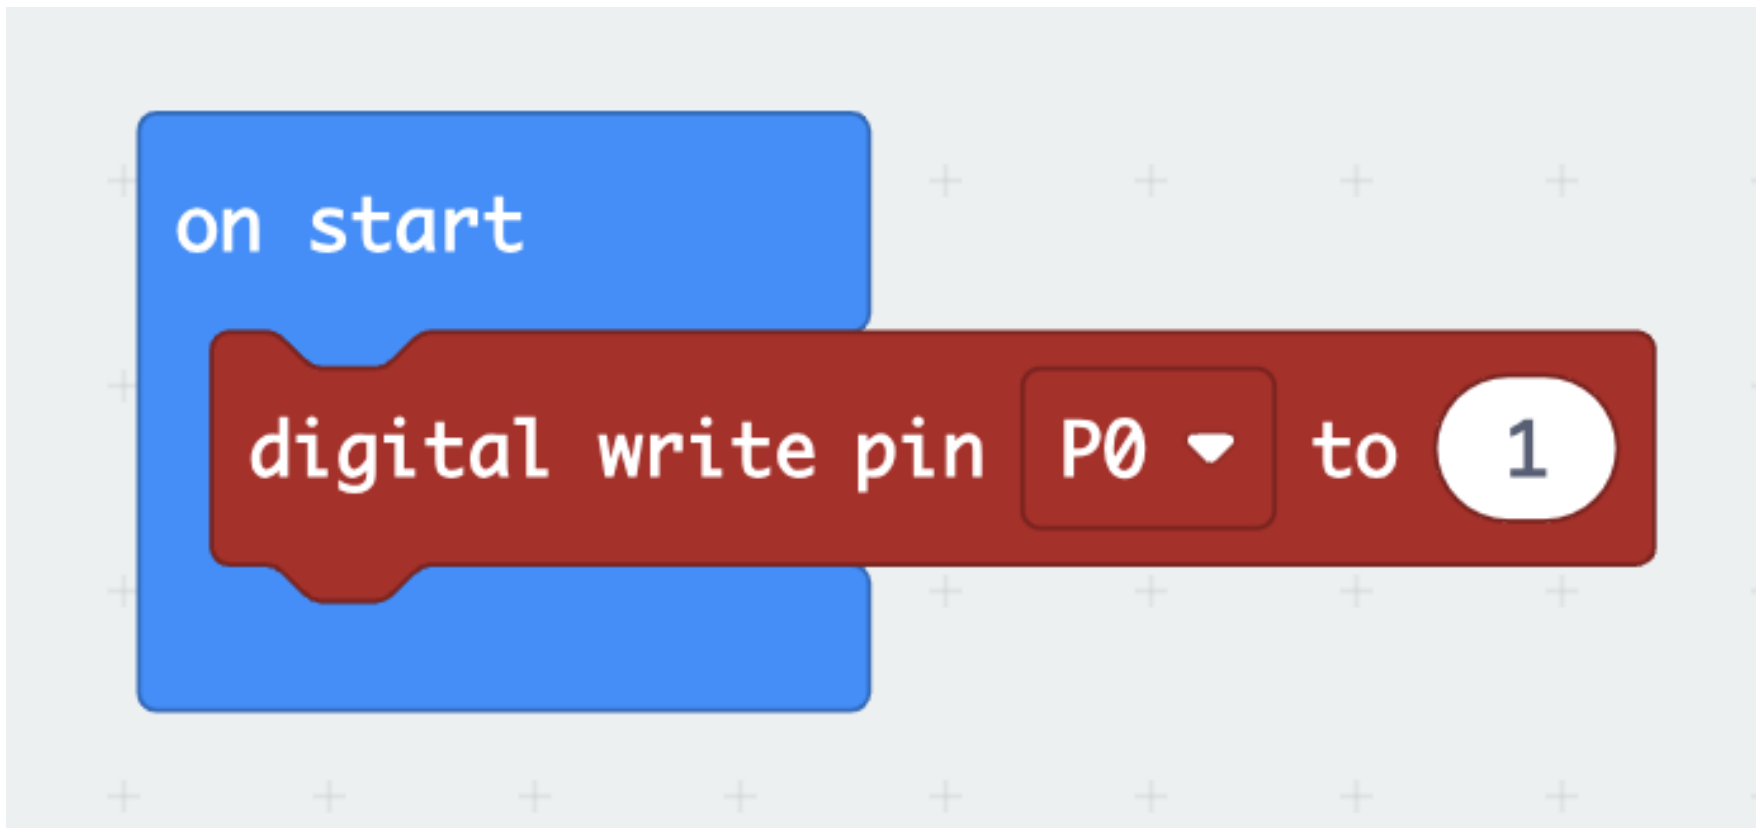

Swap the long led from the **3V** pin to pin **0**

What happens when you turn on the micro:bit?

Pin 0 is **programmable**... what might we be missing?

Let's Build a Circuit

We can program the LED to turn on with the code above!

Activity: Switch It Up

What Is a Variable?

A **variable** is something that stores data in our program. It is like a box with a label on it

I can store different things in the box, but the label stays the same

For example, I have stored the word “Bob” in my **variable** which is labelled “Name”

Switch Variable

I could have another **variable** named 'switch' which keeps track of whether our LED should be on or off

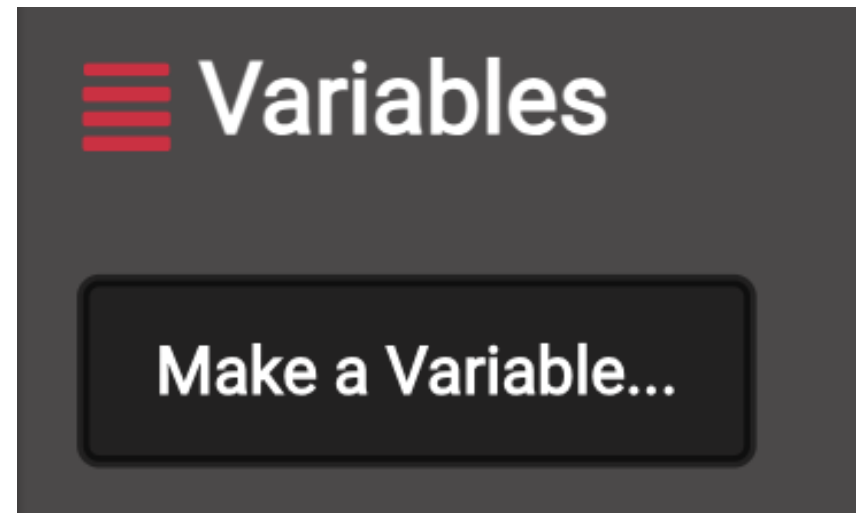

Every time we press the on/off button, our 'switch' variable will update and our micro:bit can use it to change the state of the LED

Switch It Up

Click on the variables tab and
'Make a Variable'

Call your new variable 'switch'

New variable name:

switch

Ok

Switch It Up

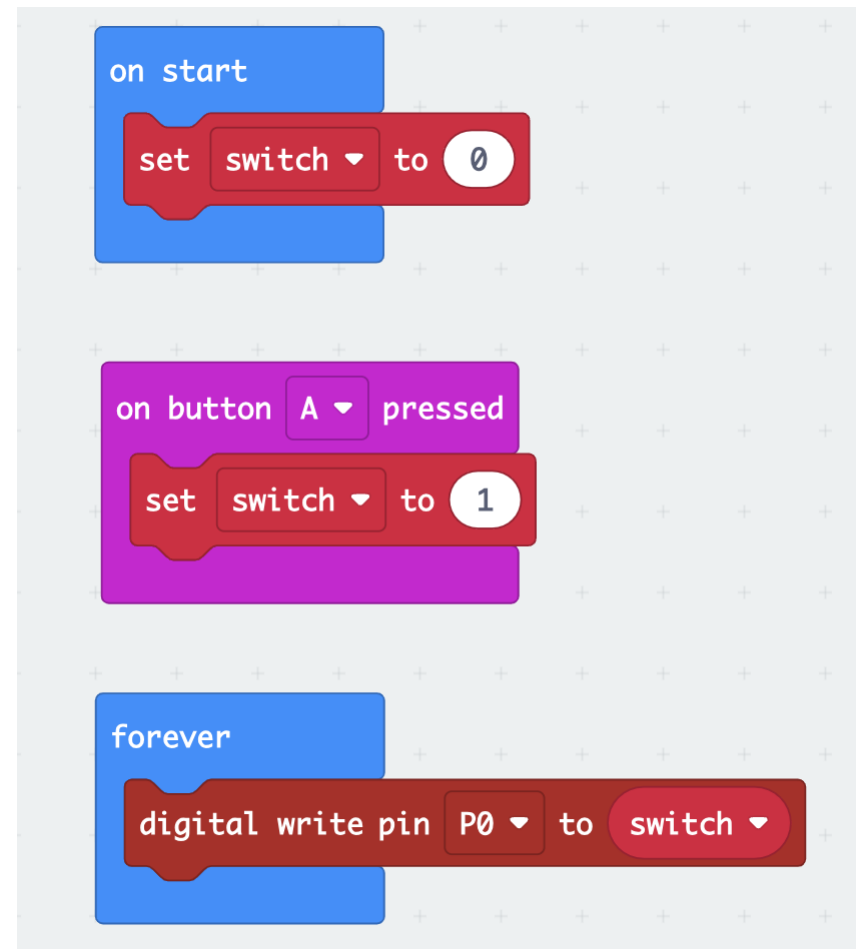

For digital devices:

0 = off **1 = on**

Set your switch variable to **0**
(**off**) on start

Set your switch variable to **1**
(**on**) when the 'A' button is
pressed

Forever set pin 0 to equal your
switch variable

Conditions

- Feature of a programming language which helps us perform different actions based on different conditions.
- These conditions should always result either in Yes/No or True/False.
- Example:
 - If your age is > 17 then**
You are eligible to drive (given that you have passed your tests).
 - else**
You have to wait until you are eligible.
- The condition in the example above can either be true or false. Your age can either be > 17 or less than 17.
- What happens if your age is 17?

Conditional Expressions

- You can create conditions using expressions.
- These expressions use mathematical operators.

Operator	Meaning
<	Less than
>	Greater than
<= or ≤	Less than or equal to
>= or ≥	Greater than or equal to
=	Equal to
≠	Not equal to

Logic

- In Micro:bit these conditional statements are placed under [Logic](#) section.
- It has the conditionals, the comparison operators and the logical operators.

Switch It Up

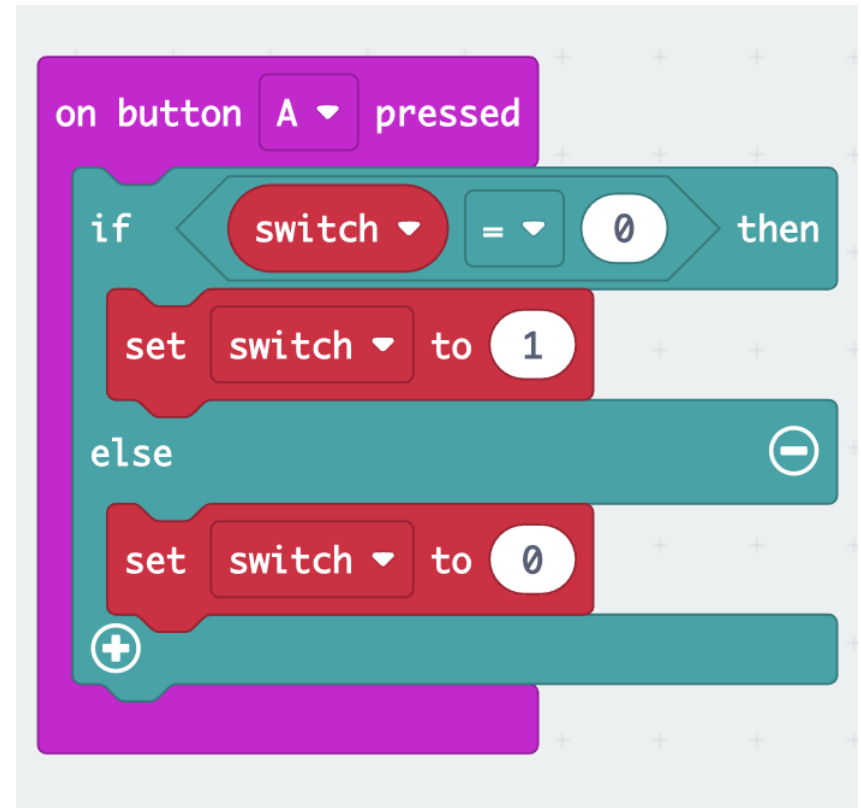

We can use an **if else** statement to update our switch variable every time the button is pressed

Create the statement:

if switch = 0

If this statement is true, we should set the switch variable to **1** when the button is pressed

Else we can set it to **0**

Activity: Improving the Circuit

Breadboard

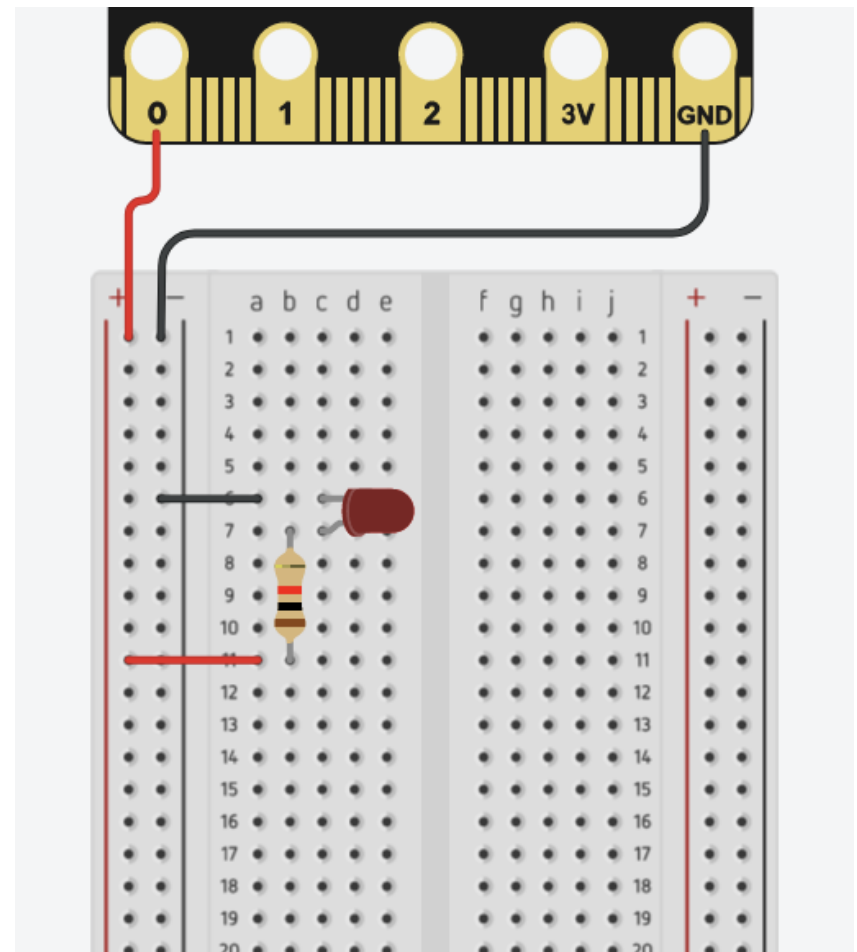

Improving the Circuit

We can use a breadboard to:

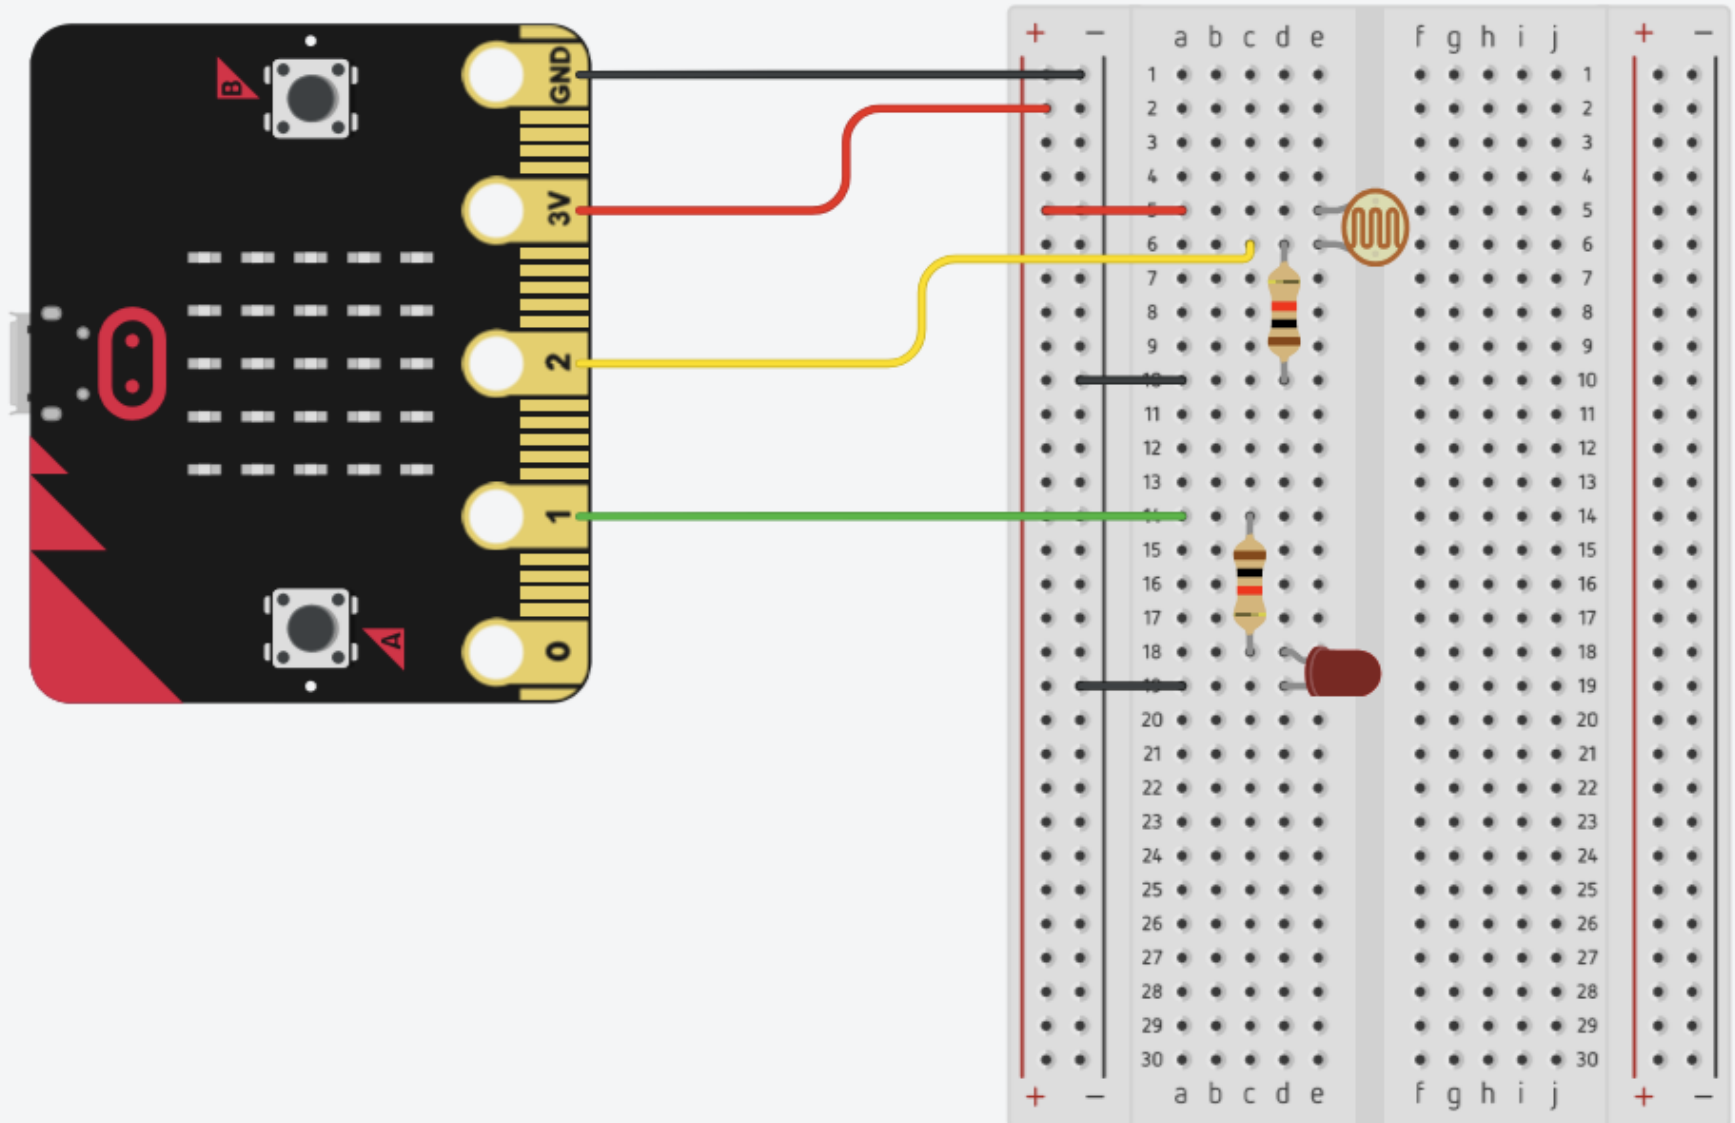

- Make our circuit neater
- Add new components to our circuit
- Look after our components and stop them burning out

Follow the diagram to improve your circuit and add a resistor

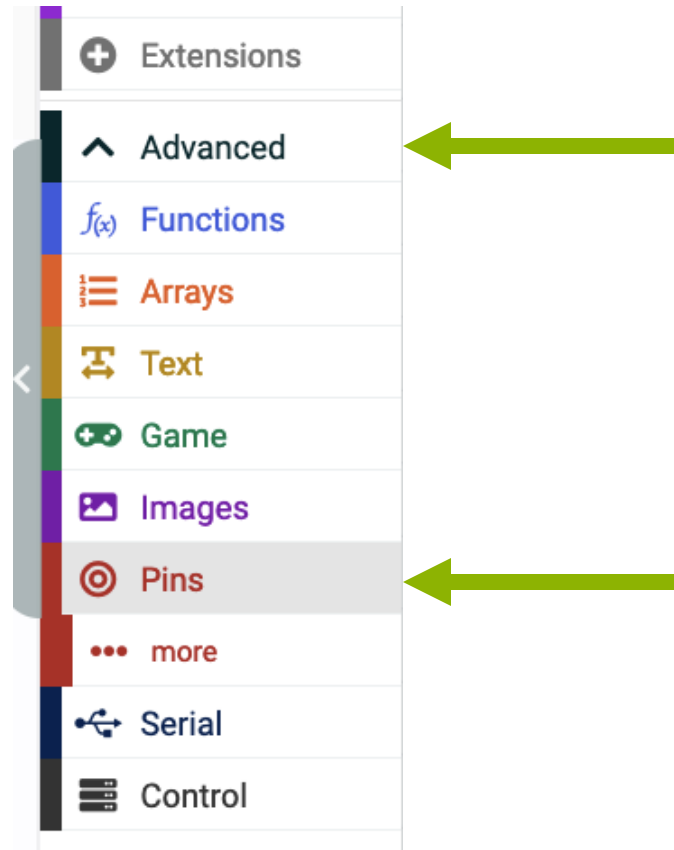

Activity: Making our Circuit Smart

Automatic Light Circuit

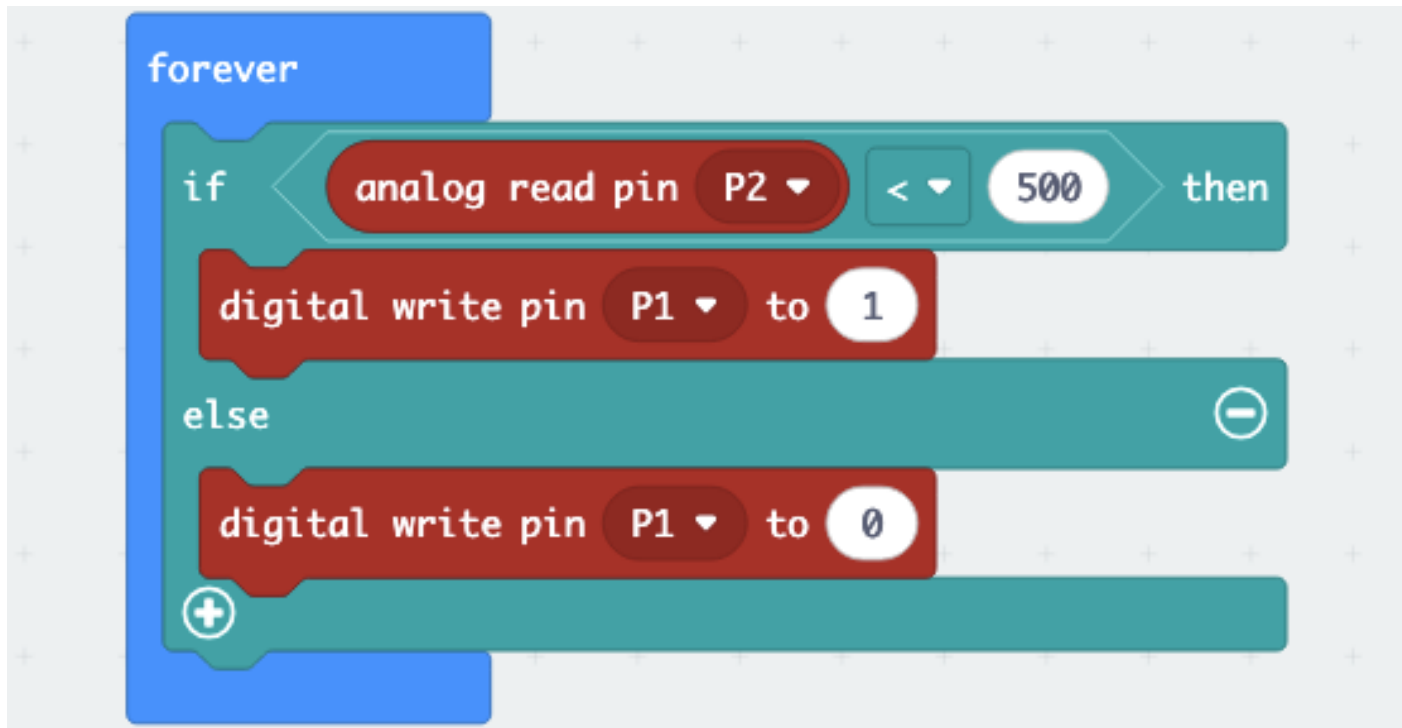

Programming Our Circuit

We will need blocks from the **Pins** tab in the **Advanced** menu

Programming Our Circuit

If the light sensor reading is low enough, the LED turns on

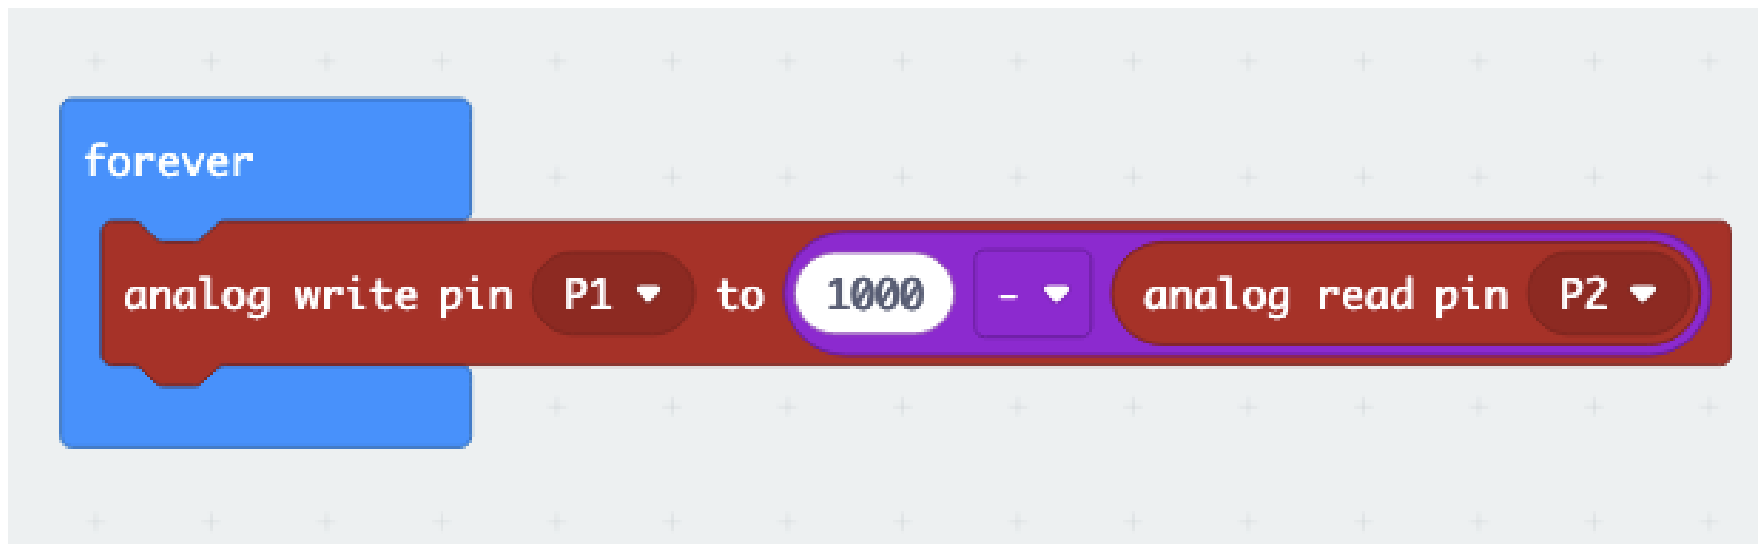

You may need to experiment to find a suitable threshold on pin 2!

Automatic Dimming

We could also try an analogue write to create a dimmer switch

We can subtract our light sensor reading from the maximum analogue value we can send to our LED to create the effect

You may need to experiment to make it work well!
